

CONTINUOUS GALVANISING LINE

Backed by the Japanese technology, the Continuous Galvanising Line (CGL) started production in 1998 with the rated capacity of 100,000 metric tons per annum. In keeping abreast with the latest technological advancement in the industry, YKGI complies strictly with technical updates for applications in order to maintain its competitive edge. Our second CGL, started its operation in October 1999. This

CGL is specialised in producing thinner gauges and the rated capacity is 25,000 metric tons per annum.

Corrosion Protection for Zinc-coated Steel Sheets

The most obvious approach to the protection of steel against corrosion is to isolate the steel surface from oxygen and water. Zinc-

The Continuous Colour Coating Line (CCL) began operation in April 1996 with the production capacity of 40,000 metric tons per annum. This computer automated line is capable of a 2-coat and 2-bake process and is equipped with a floater oven. Pre-painting is a process whereby a

special paint coating is continuously applied to hot-dip galvanised steel sheets followed by curing in ovens. The process involves the application of high-grade coating materials with excellent adhesive and weather resistance properties to both sides of the surface of the sheet.
